Appl.No.: 09/668,844

Amendment dated July 26, 2004

Response to Office Action mailed April 26, 2004

Amendments to the Specification:

Please replace the first full paragraph on page 4 with the following amended

paragraph:

These feature features each has advantages including a low-bit-rate

hybrid coder using the voicing of weakly-voiced frames to enhance the waveform

coder and avoiding phase discontinuities at the switching between parametric

and waveform coded frames.

Please replace the last paragraph on page 6 with the following amended

paragraph:

Analysis by Synthesis 114 is used by the CELP coder for weakly-voiced

frames to encode the pitch, pitch-predictor gain, fixed-codebook contribution, and

codebook gain. The initial pitch estimate is obtained from the pitch-and-voicing

analysis. The fixed codebook is a sparse codebook with four pulses per 10 ms

(80-sample) sub-frame. The pitch-predictor gain and the fixed excitation gain are

quantized jointly by Quantization 112 110.

Please replace the fifth paragraph on page 7 with the following amended

paragraph:

Postfilter 144 with coefficients derived from LP parameters provides ...

enhanced formant peaks.

Please replace the first paragraph on page 12 with the following amended

paragraph:

Appl.No.: 09/668,844

Amendment dated July 26, 2004

Response to Office Action mailed April 26, 2004

The $\{X[k]\}$ may be estimated by applying a discrete Fourier transform to the samples of a single period (or small number of periods) of e(n) as in Figures 3b-3e 2a-2b. The preferred embodiment only uses the magnitudes of the Fourier coefficients, although the phases could also be used. Because the LP residual components $\{e(n)\}$ are real, the discrete Fourier transform coefficients $\{X(k)\}$ are conjugate symmetric: $X(k) = X^*(N-k)$ for an N-point discrete Fourier transform. Thus only half of the $\{X(k)\}$ need be used for magnitude considerations. Of course, with a pitch period of p samples, N will be an integer equal to [p] or [p]+1.

Please replace the first paragraph on page 12 with the following amended paragraph:

(2) apply speech activity detection to each of the six eight 20-sample subframes of the frame; the speech activity detection may be by the sum of squares of samples with a threshold.

Please replace paragraph (12) on page 15 with the following amended paragraph:

(12) pick the pitch candidate as follows (compare Figure 3): if pcorr[0] is less than 4*threshold, then put i = -1; if pcorr[0] is at least 4*threshold, then i = 0 unless pcorr[k] is at least 0.8*pcorr[0], then take i = the largest such k unless additionally pcorr[k] is less than 0.9*pcorr[0] in which case take i = -1.
